

**Insulin-like growth factor (IGF) II ELISA for normal breast-associated fibroblasts (NAF), carcinoma-associated fibroblasts (CAF), and MCF10A cells and MCF10AT cells in monolayer cultures**

| Cell type               | IGF II level (normalized to total protein) |              |
|-------------------------|--------------------------------------------|--------------|
|                         | Level (ng/μg)                              | Mean (ng/μg) |
| NAF                     |                                            |              |
| NAF-1                   | 11.63                                      | 7.79         |
| NAF-2                   | 6.87                                       |              |
| NAF-3                   | 10.31                                      |              |
| NAF-4                   | 7.21                                       |              |
| NAF-5                   | 2.92                                       |              |
| CAF                     |                                            |              |
| CAF-1                   | 11.80                                      | 11.42        |
| CAF-2                   | 10.58                                      |              |
| CAF-3                   | 10.59                                      |              |
| CAF-4                   | 11.27                                      |              |
| CAF-5                   | 10.21                                      |              |
| CAF-6                   | 14.07                                      |              |
| Breast epithelial cells |                                            |              |
| MCF10A                  | 5.56                                       | 4.87         |
| MCF10AT                 | 4.17                                       |              |
